

Student Course Registration System

Functional Requirements

ID	Feature	Description
FR1	User Authentication	The system shall provide a secure login and authentication module for verified student access.
FR2	Course Viewing	The system shall allow students to view available courses per semester or program.
FR3	Course Registration	The system shall enable students to register for courses within defined constraints, such as prerequisites and unit limits.
FR4	Course Dropping	The system shall allow students to remove registered courses when necessary.
FR5	Data Management	The system shall reliably store and manage student registration records in a centralized database.

4.2.2 Non-Functional Requirements

Non-functional requirements describe how the system performs its functions. They define quality attributes such as performance, usability, reliability, and security.

Non-Functional Requirements Table

Requirement Category	Requirement	Description

Usability	User-Friendly Interface	The system shall provide a secure, intuitive, and easy-to-use interface that allows students to self-manage their registrations.
Platform	Web-Based Architecture	The system shall operate as a web-based application accessible via standard web browsers.
Scalability	System Scalability	The system shall be capable of scaling efficiently to handle growing student numbers without a drop in performance.
Reliability	Data Accuracy	The system shall maintain a reliable, centralized record of enrollments to prevent errors like double registrations or incorrect unit allocations.

Potential Stakeholders

- **Students:** The primary end-users who will be interacting with the system to view, register for, and drop courses.
- **Registrar's Office Staff:** The administrators who manage the academic calendar, oversee enrollment numbers, and require accurate, centralized records.
- **Academic Advisors / Department Heads:** The faculty members who define course availability, prerequisite rules, and unit limits for their specific programs.
- **IT Administrators:** The technical staff responsible for maintaining the system, ensuring security, managing server loads during peak registration, and handling user authentication.

Stakeholder Interview Questions

To get the most out of your interviews, it helps to tailor your questions to the specific role of the stakeholder.

Questions for Students

- What are your biggest frustrations with the current manual or fragmented registration process?
- What specific information do you need to see about a course before you decide to register for it?
- How would you expect the system to notify you if you try to register for a course but do not meet the prerequisites?
- What device (laptop, tablet, smartphone) do you primarily plan to use when accessing this registration system?

Questions for the Registrar's Office

- What are the most common errors (e.g., double registrations) you encounter with the current system, and how are they resolved?
- What specific data or reports will you need to extract from the new centralized database to monitor enrollment?
- How does the institution define the opening and closing windows for registration and drop periods?

Questions for Academic Advisors / Department Heads

- What are the absolute minimum and maximum unit limits a student can register for in a single semester?
- Are there any complex prerequisite rules or co-requisites (courses that must be taken together) that the system needs to be aware of?
- If a course reaches its maximum capacity, should the system simply block registration, or does there need to be a waitlist feature?

Questions for IT Administrators

- What is the expected maximum number of students who might try to access the system concurrently during the peak of registration week?
- What existing student database or Single Sign-On (SSO) system must this new application integrate with for secure authentication?
- What are the security and data privacy standards the institution requires for storing student enrollment records?
